

SEN4017 Project: Music Player

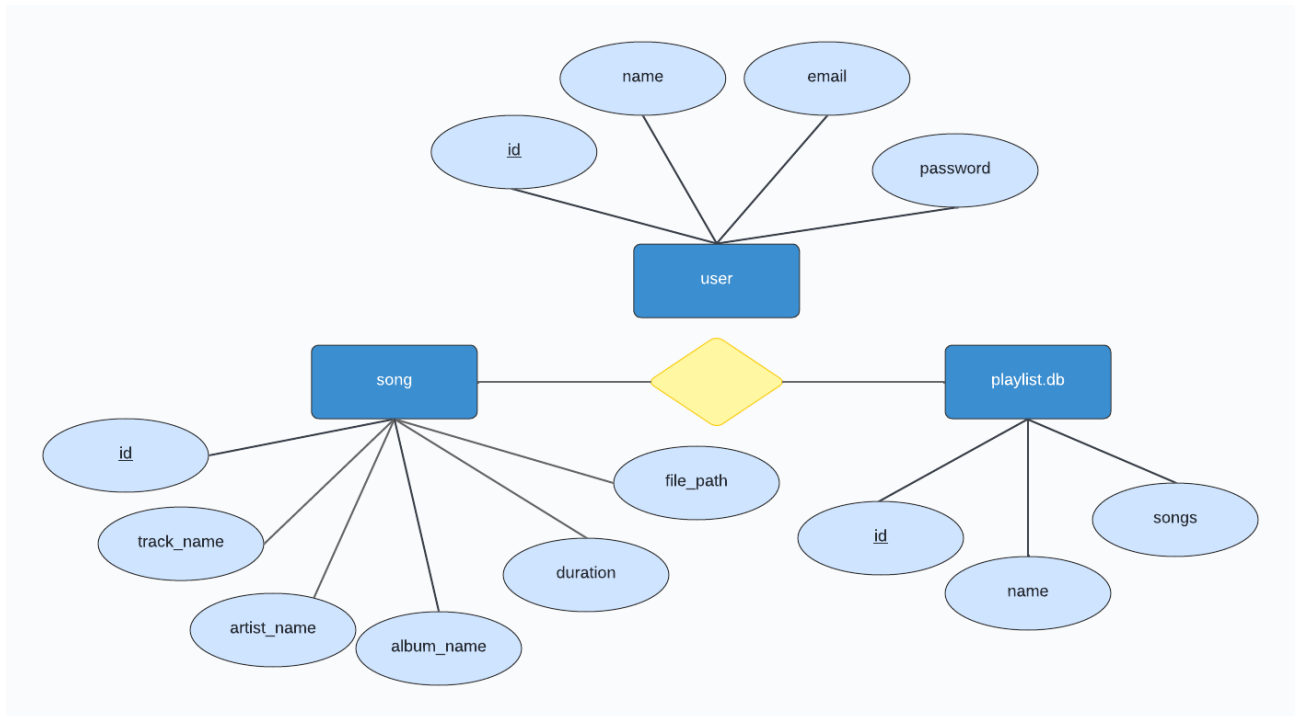

- a. Music Player application allows users to create accounts, create playlists, add tracks into them and listen to the songs they added to their playlists. Users login/signup through entering their credentials which are saved to the database. Users can add new playlists or delete playlists, add songs into the playlists and play songs by selecting a playlist and a song from their treeviews. Users can pause, unpause, and rewind songs, listen to them and view their album cover.

b. Schema Diagram:

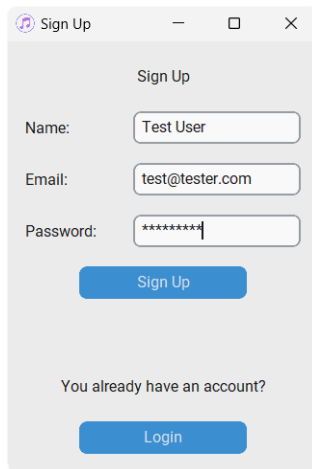

c. GUI Windows

1. Welcome Page

The application starts with the welcome page. The user is given two options, either to login or to signup by clicking one of the buttons. After clicking one, the user is forwarded to the according GUI.

2. Sign Up

Password:

You already have an account?

Success

Account created successfully.

The application starts with the sign up page. Users enter their credentials to the according text fields to create their accounts. If user already has an account, they can be forwarded to the login GUI via the *Login* button. Name, email, and password text fields have certain filters to avoid execution of database tasks with invalid inputs. Email and password input criteria is based on universal standards, and

password is saved to the database after hashing for data security. If the user enters an invalid input, they are informed accordingly as shown in the figures:

Sign Up

Songs

ID	Track Name	Artist Name	Album Name	Duration
----	------------	-------------	------------	----------

Main Page is where users can view already created playlists, create playlists, delete playlists, add songs to the selected playlist, and play music from the selected playlist. The treeview for

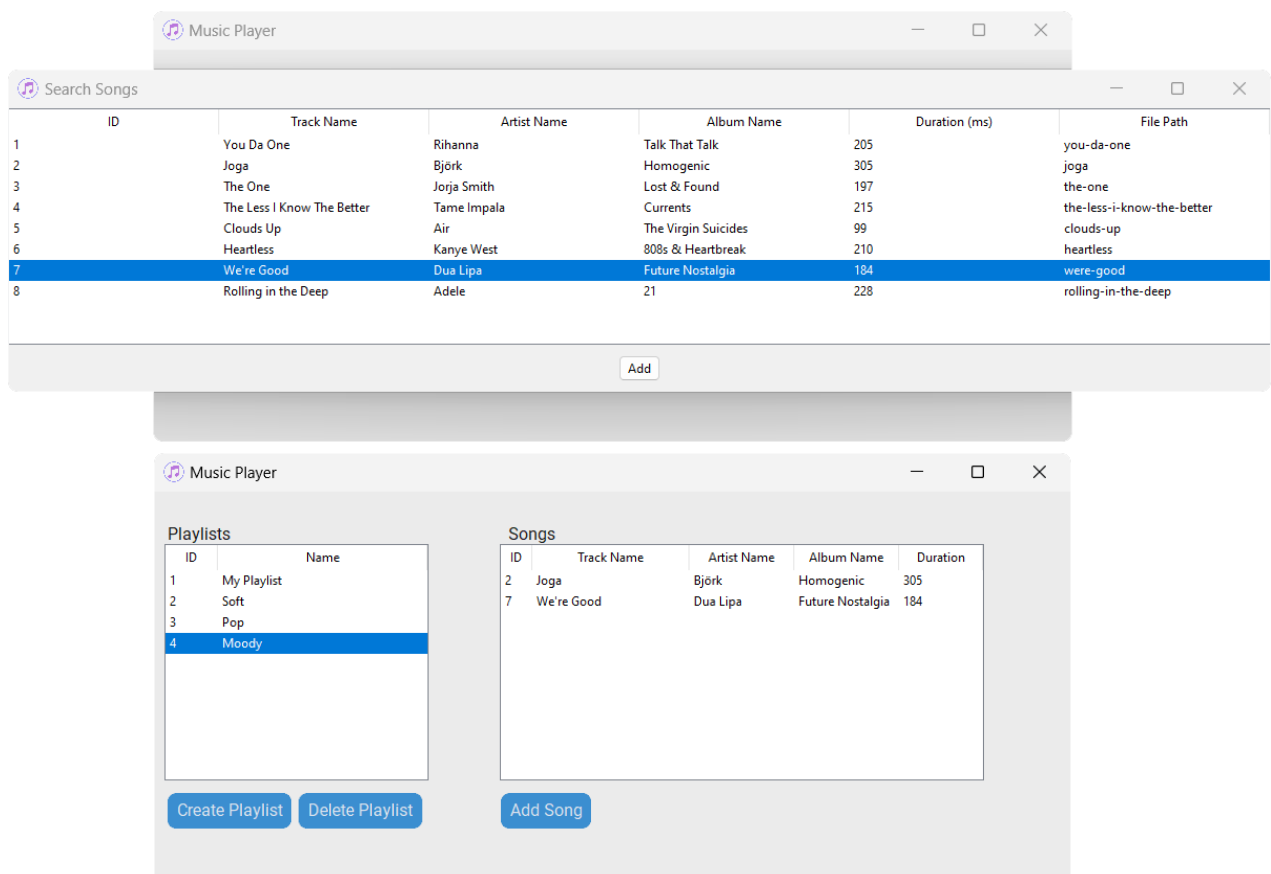

playlists and songs use *playlist.db* and *song.db* to gather data from. Once a playlist is clicked, users can view the songs inside and make additions themselves. *Create Playlist* button forwards users to the Create Playlist GUI and *Add Song* button forwards users to the Search Song GUI.

5. Create Playlist

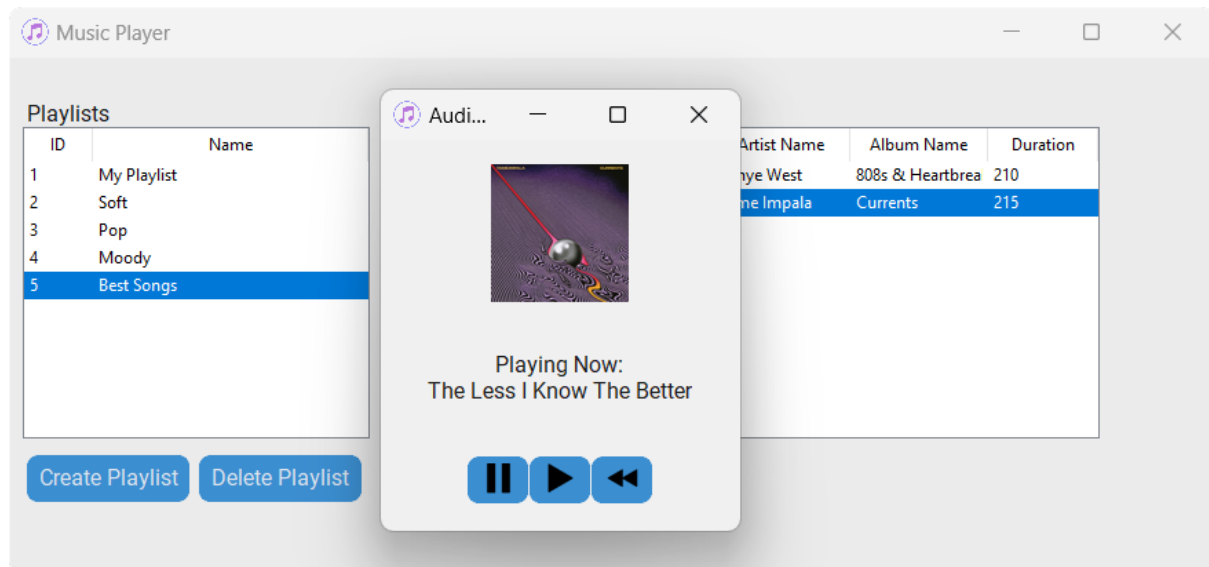

Create Playlist GUI adds a new playlist with the given name to the *playlist.db*.

6. Search Song

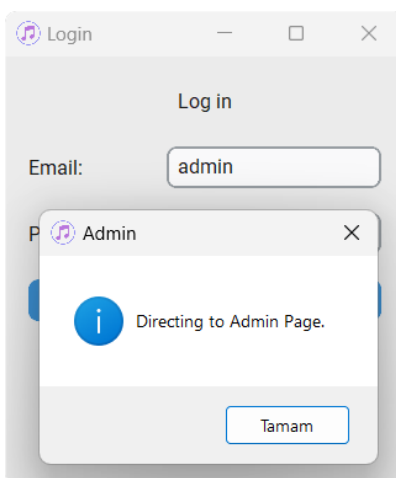

At the search song GUI, all songs at the database are displayed to the user at a treeview where then can select the ones they want and add them their selected playlist by clicking on the *Add* button.

7. Audio Player

After double clicking on a song of a playlist, user is forwarded to the Audio Player GUI where the selected song is played. There are three buttons to pause, start, and rewind the music. pygame is used for playing the music. pygame gathers the music from the `~/src/songs` file and finds each song by their file path attributes.

8. Admin Page

By writing the admin credentials at the login page, the user is forwarded to the admin page where they can edit users or add new songs to the database.

9. Add Song

Song Database

Track Name: Joga

Artist Name: Björk

Album Name: Homogenic

Duration (ms): 305

File Path: joga

7	We're Good	Dua Lipa	Future Nostalgia	184	were-good
8	Rolling in the Deep	Adele	21	228	rolling-in-the-deep

joga

New songs can be added to the database using this GUI. It has several text fields and a treeview which represent the columns of *song.db*. By entering inputs at the text fields, clicking on save and delete buttons; users can save new songs, edit existing songs, or delete songs. *song.db* is displayed at the treeview and *database.py* is used for that function as in other tables throughout the project.

10. Edit Users
